

PECS 2012 Conference: Rockland Scientific

Rockland Scientific specializes in turbulence measurements in the marine environment. We design and manufacture innovative instrumentation, software, and measurement solutions for coastal and deep-ocean deployment. Our shear probe-based instruments provide a high signal resolution of velocity and scalar fluctuations, resolving turbulent dissipation rates as low as $1e-11$ W/kg. VMP profilers are reliable instruments for measuring turbulent mixing in the water column. The modular MicroRider can be deployed on a variety of platforms, such as AUV, gliders, profiling floats and CTD cages. The MicroSquid measures turbulent transport of heat, oxygen, or conductivity using the eddy correlation method. For more product and contact information, visit our website at www.rocklandscientific.com.
