

Dr. Amy Bower: Red Sea Outflow Experiment

co-PIs: Amy Bower and David Fratantoni (WHOI)
Bill Johns and Hartmut Peters (RSMAS)

Project Summary

The Red Sea Outflow Experiment (REDSOX) was a joint effort between the University of Miami's Rosenstiel School of Marine and Atmospheric Science (RSMAS) and WHOI. The purpose of the program was to conduct measurements of the outflow of high salinity water from the Red Sea and its mixing with ambient waters in the Gulf of Aden. The main objectives of REDSOX were: 1) to describe the pathways and downstream evolution of the descending outflow plumes of Red Sea Water in the western Gulf of Aden, 2) to quantify the process that controls the final depth of the equilibrated Red Sea Outflow Water, and 3) to identify the transport processes and mechanisms that advect Red Sea Outflow Water and its properties through the Gulf of Aden and into the Indian Ocean. The program was funded by NSF.

For a copy of the float data collected as part of this project, please contact Dr. Amy Bower at abower@whoi.edu.
