

Biogeochemical cycling in anoxic sediments

Consortia of bacteria are needed to degrade
Complex organic mater

Waste products of one bacteria serve as the substrate for another

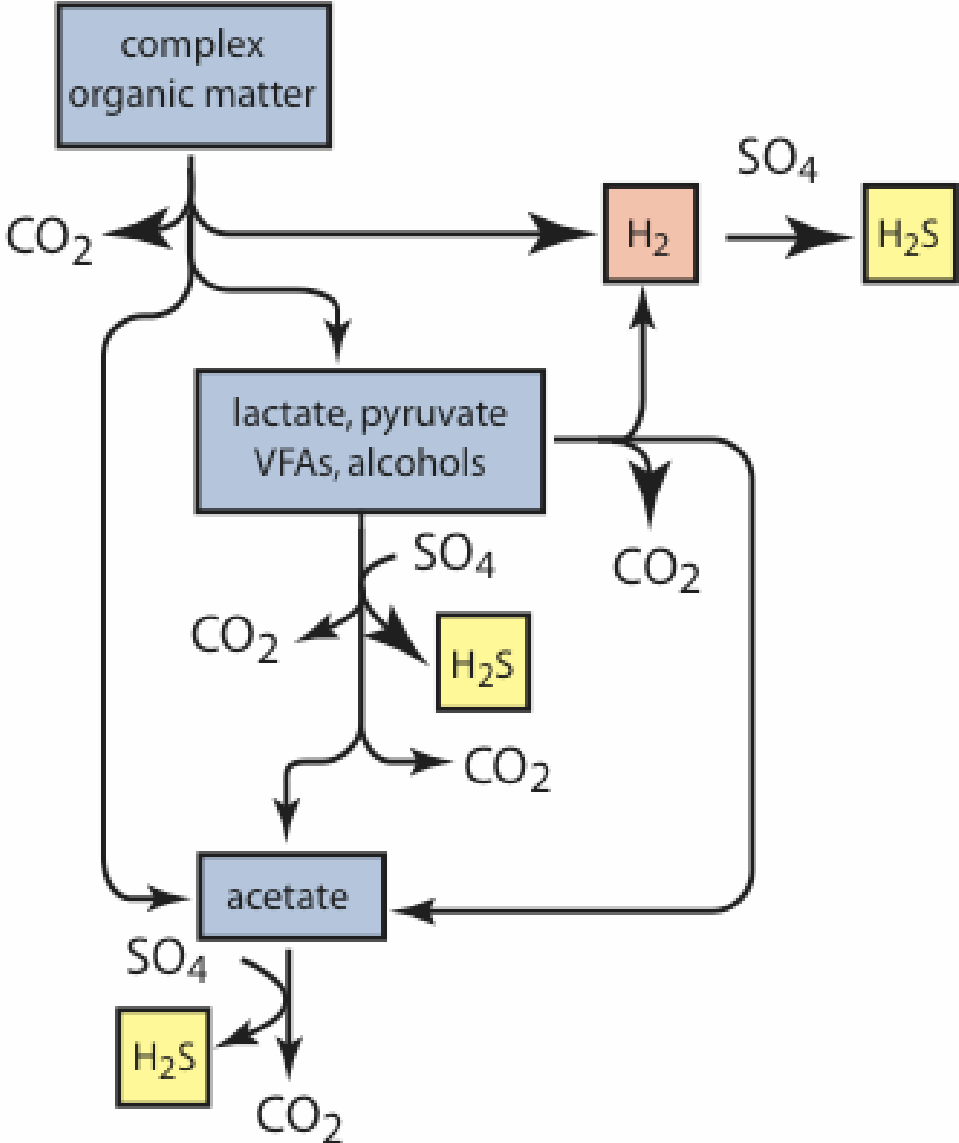

Major reactions are fermetation, sulfate reduction, and methanogenesis

Biogeochemical zonation occurs due to differences in free energy of TEA yields

C oxidation in CLB sediments show fluxes and processes are
In balance, suggesting all major pathways are accounted for.

Natural system closely resembles that expected
from pure culture work.

Sulfate Present

Sulfate and Methane in CLB sediments (August)

Molecular hydrogen as a control on organic matter oxidation in anoxic sediments

Is C oxidation in anoxic sediments under thermodynamic or kinetic control?

(e.g. $\text{X}_{\text{ox}} = \text{SO}_4^{2-}$ $\text{X}_{\text{red}} = \text{S}^{2-}$)

$$\Delta G_{\text{rxn}} = \Delta G_{(T)}^{\circ} + RT \ln \left(\frac{\{\text{X}_{\text{red}}\}^m}{\{\text{X}_{\text{ox}}\}^m} (\text{P}_{\text{H}_2})^{2n} \right)$$

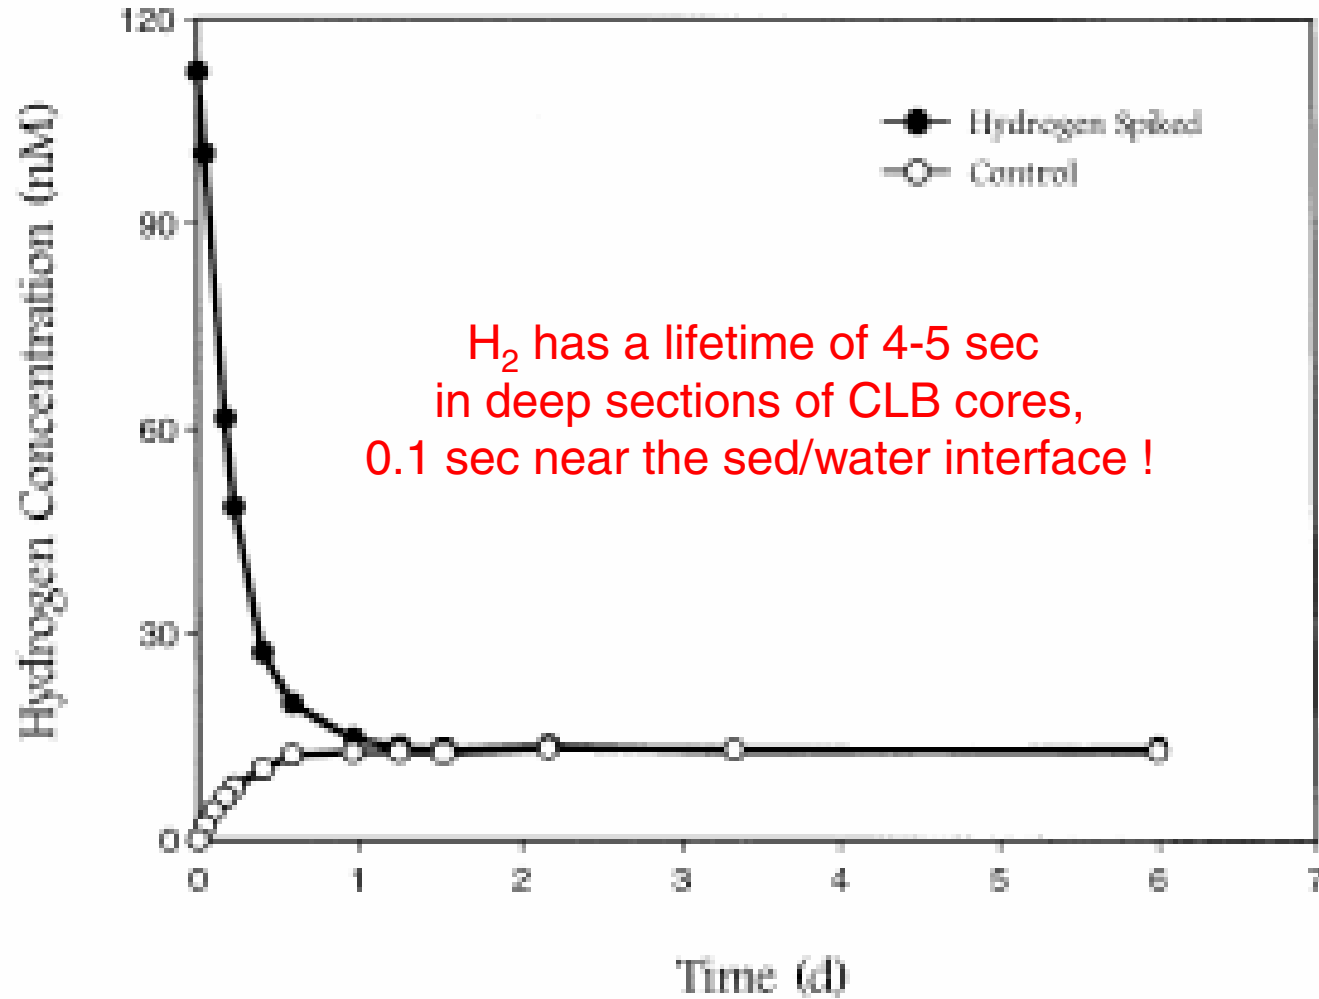

and...

$$\text{P}_{\text{H}_2} = \left(\frac{\{\text{X}_{\text{red}}\}^m}{\{\text{X}_{\text{ox}}\}^m} e^{(\Delta G_{\text{rxn}} - \Delta G_{(t)}^{\circ})/RT} \right)^{1/2n}$$

Oxidation of organic matter in marine sediments

Reaction	ΔE (KJ/mole)	Capacity (mmoles/L sed)
$O_2 \longrightarrow CO_2$	-475	0.85
$NO_3^- \longrightarrow N_2 + CO_2$	-448	0.05
$Mn(IV) \longrightarrow Mn(II)$	-349	2-22
$Fe(III) \longrightarrow Fe(II)$	-114	14-28
$SO_4^{2-} \longrightarrow S^{2-}$	-77	56
$CO_2 \longrightarrow CH_4$	-58	

Rapid cycling of H₂ in anoxic sediments

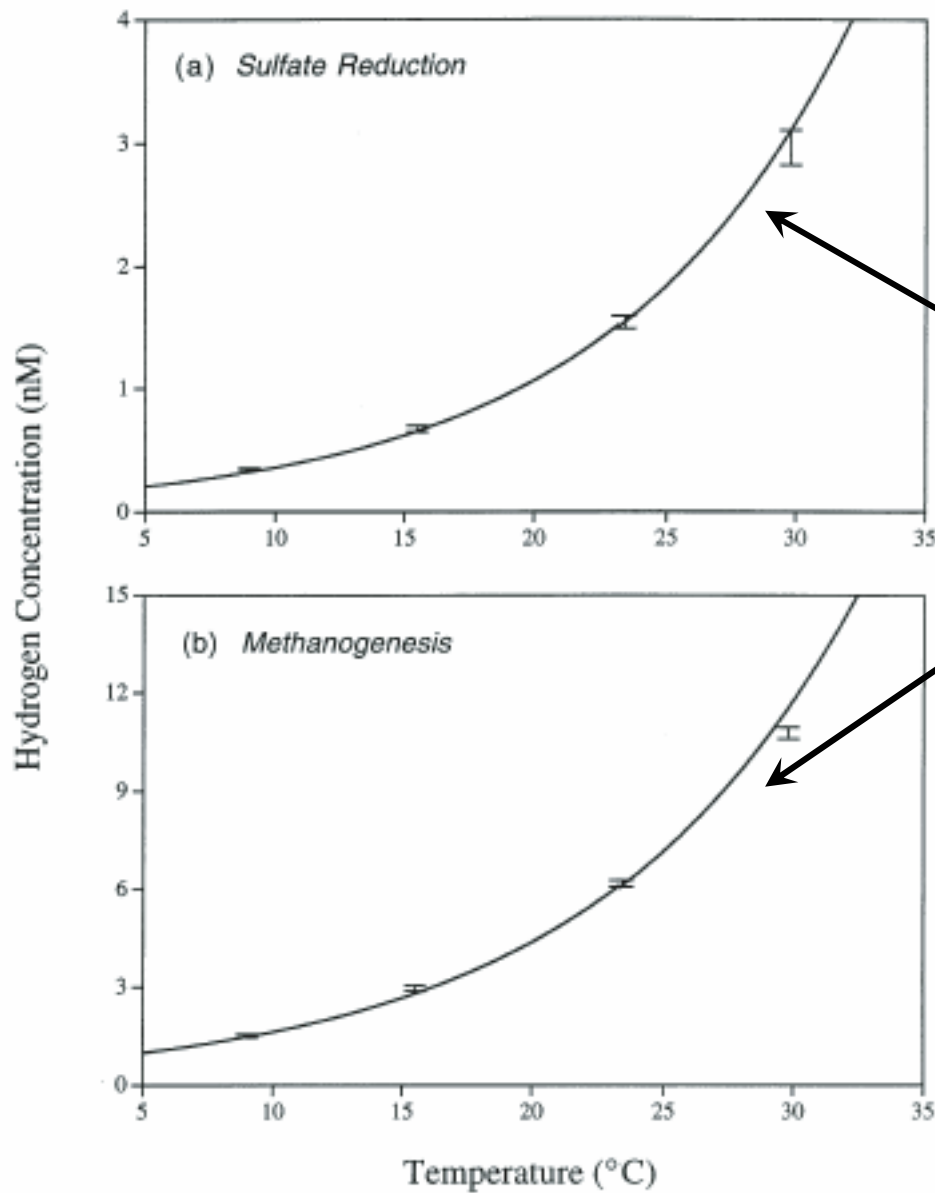

Effect of TEA on H₂ concentrations

TEAP	[H ₂] (nM)	ΔG(kJ mol ⁻¹)
Nitrate redn	0.031	<-180
Sulfate redn	1.64	-23
Methanogenesis	13.0	-20
Acetogenesis	133	-18

Effect of temperature on H₂ concentrations

ΔT from 10 to 30°C
Will affect ΔG_{rxn} by
 $+15 \text{ kJmol}^{-1}$

Theoretical
effect

Dependence of $[H_2]$ on $[SO_4^{2-}]$

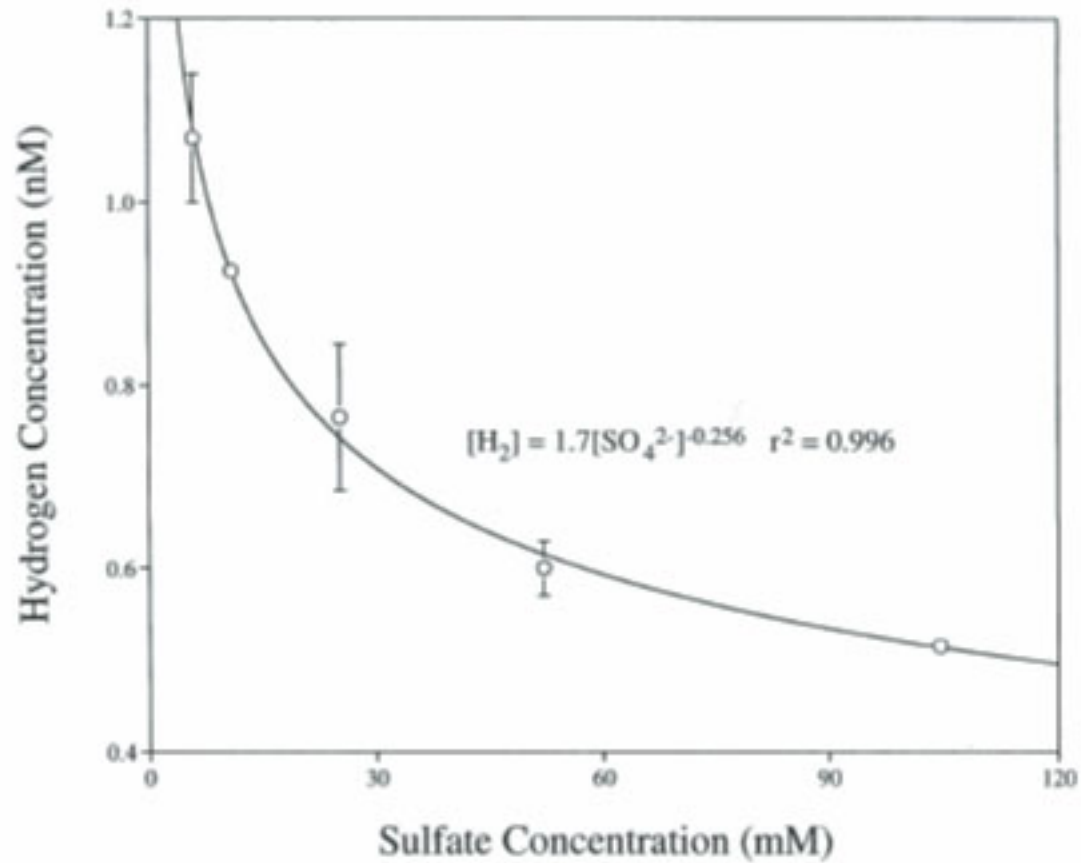

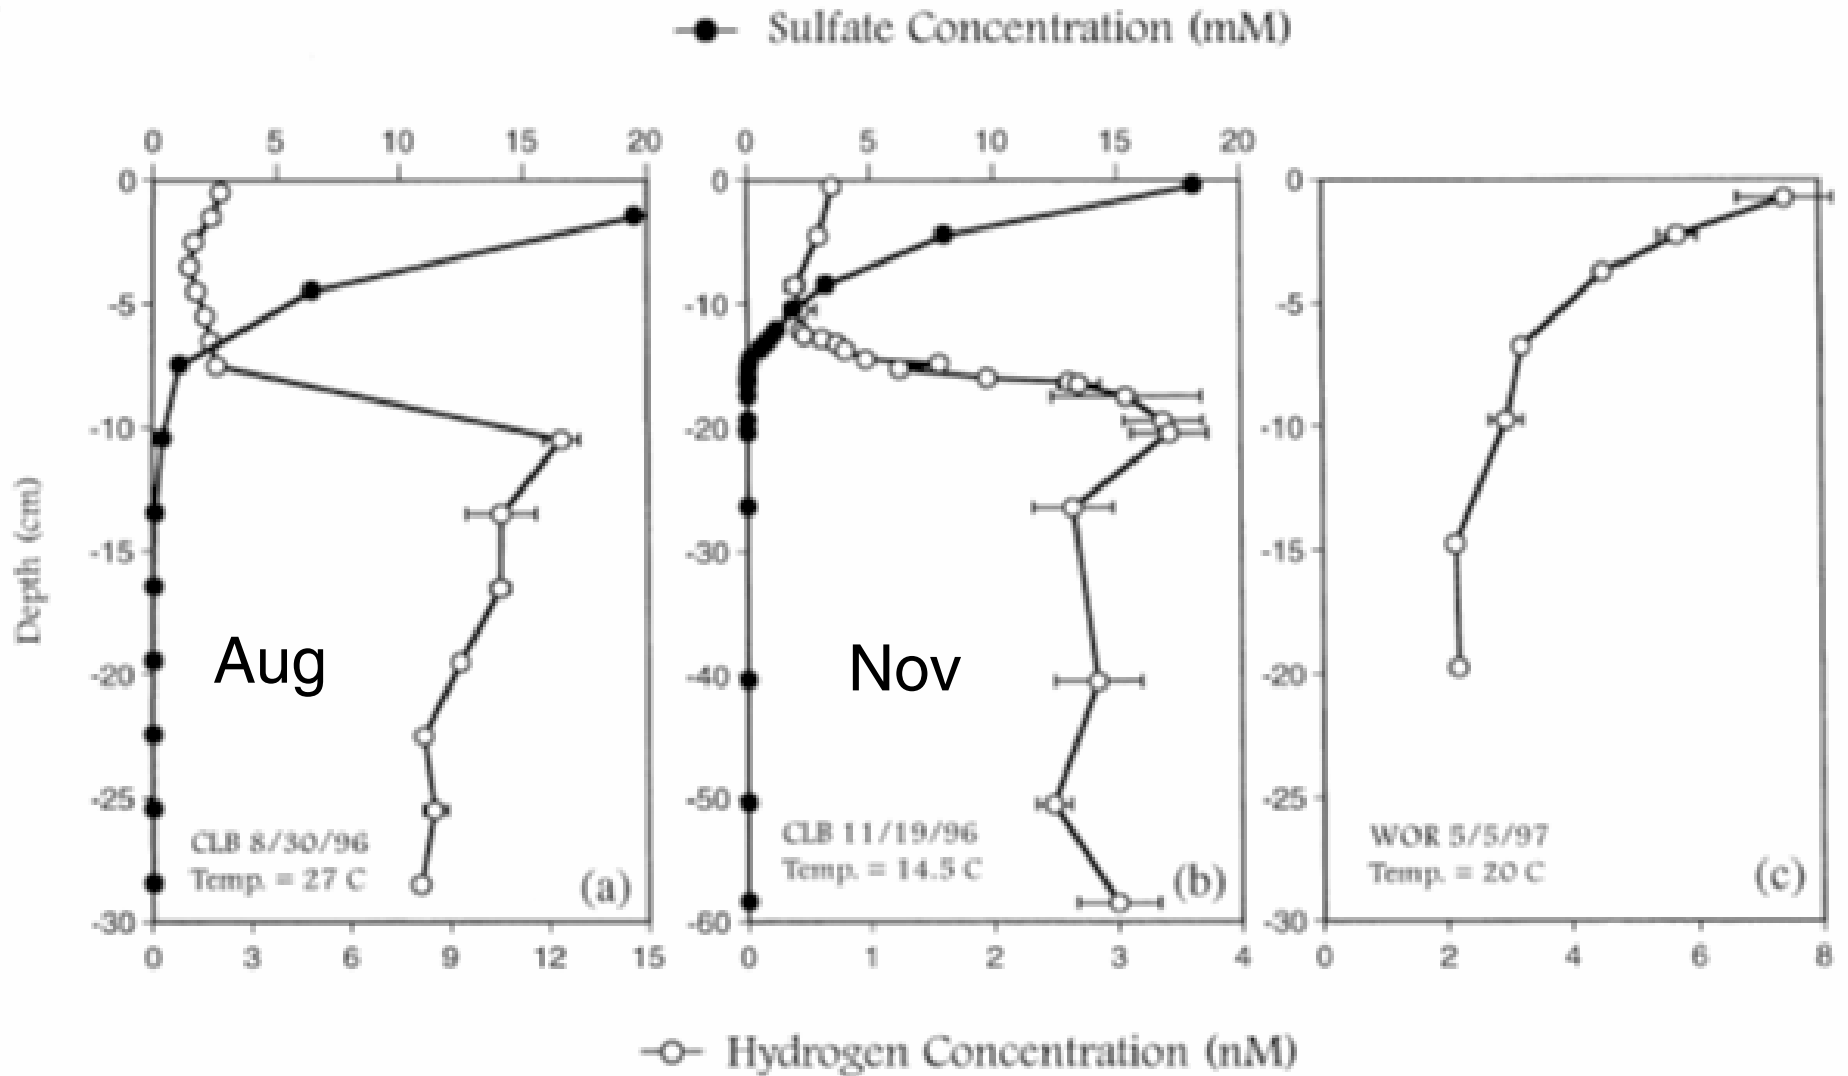

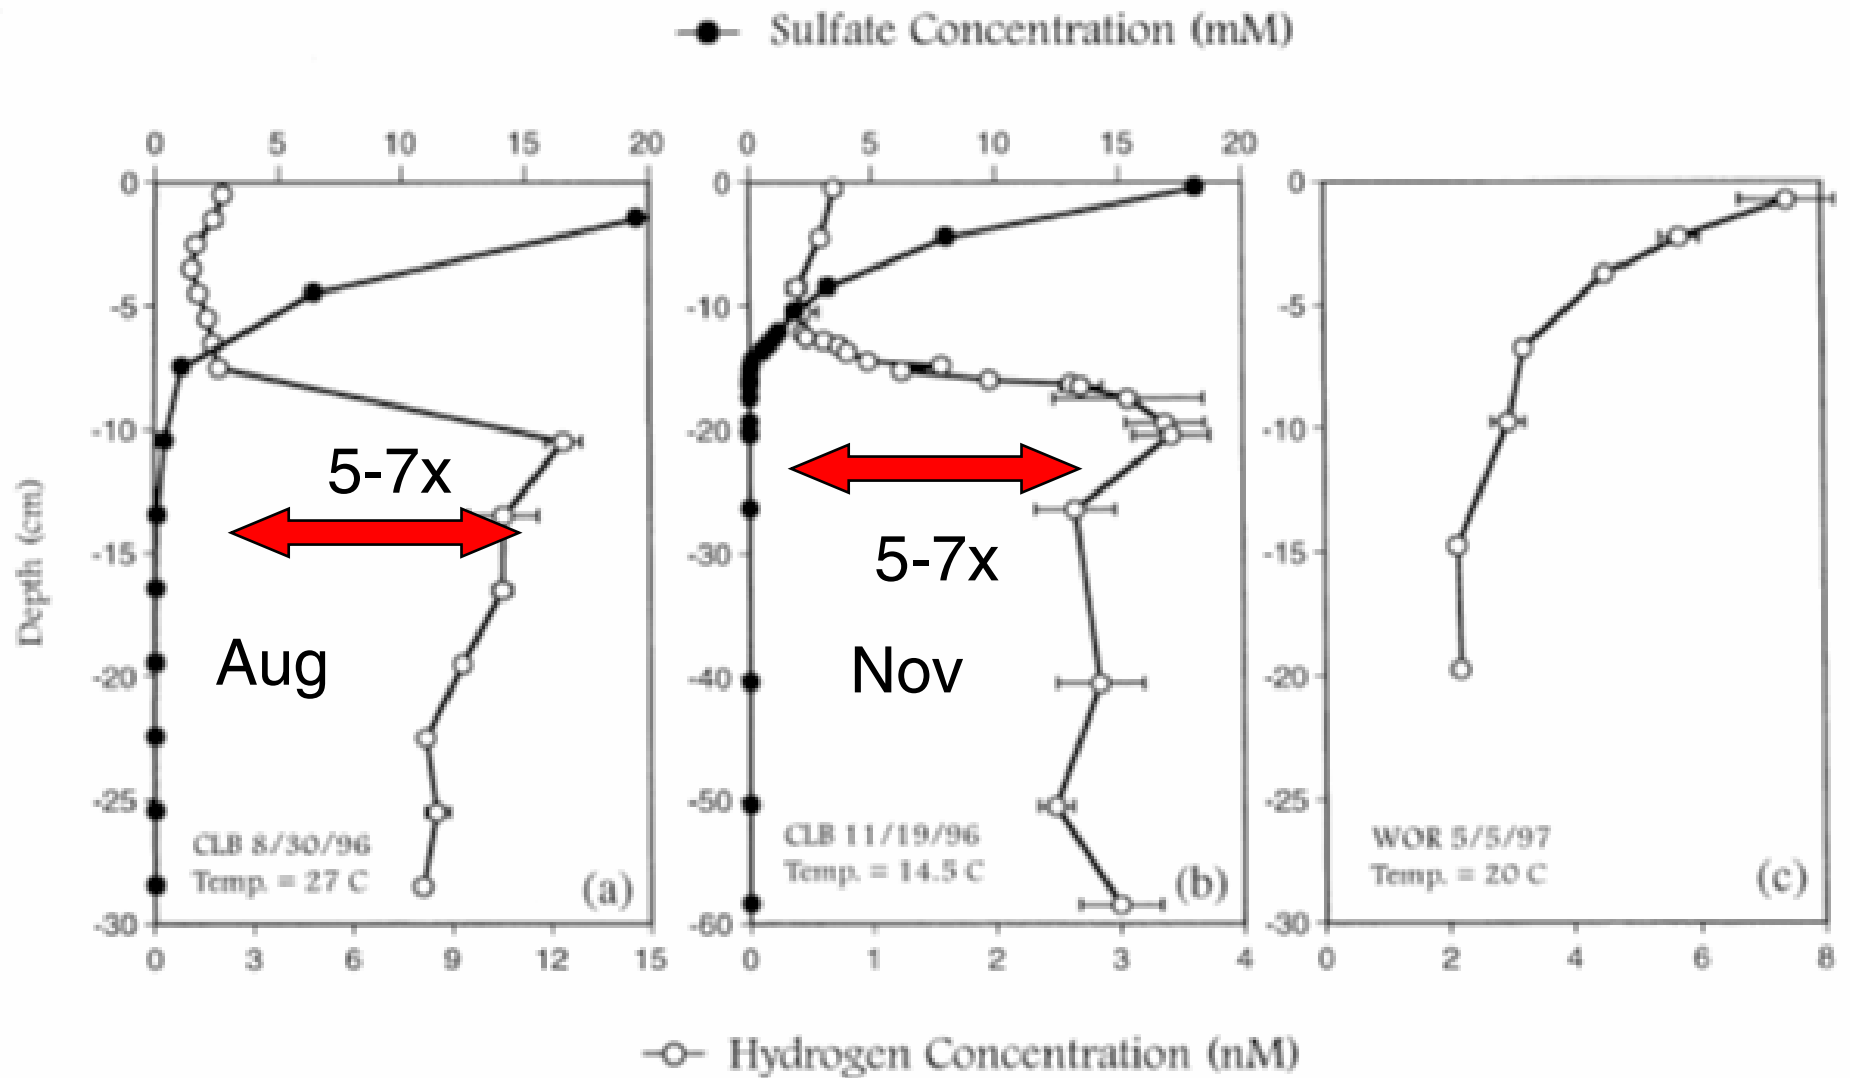

Fig. 5. Response of hydrogen concentrations to variations in porewater sulfate concentration. Error bars represent one standard deviation about the mean of triplicate sediment samples. A power function fit to the data indicates that hydrogen has an exponential dependence of -0.26 ± 0.01 on sulfate (compare to theoretical value of -0.25).

Profiles of hydrogen and sulfate in CLB and WOR sediments

Profiles of hydrogen and sulfate in CLB and WOR sediments

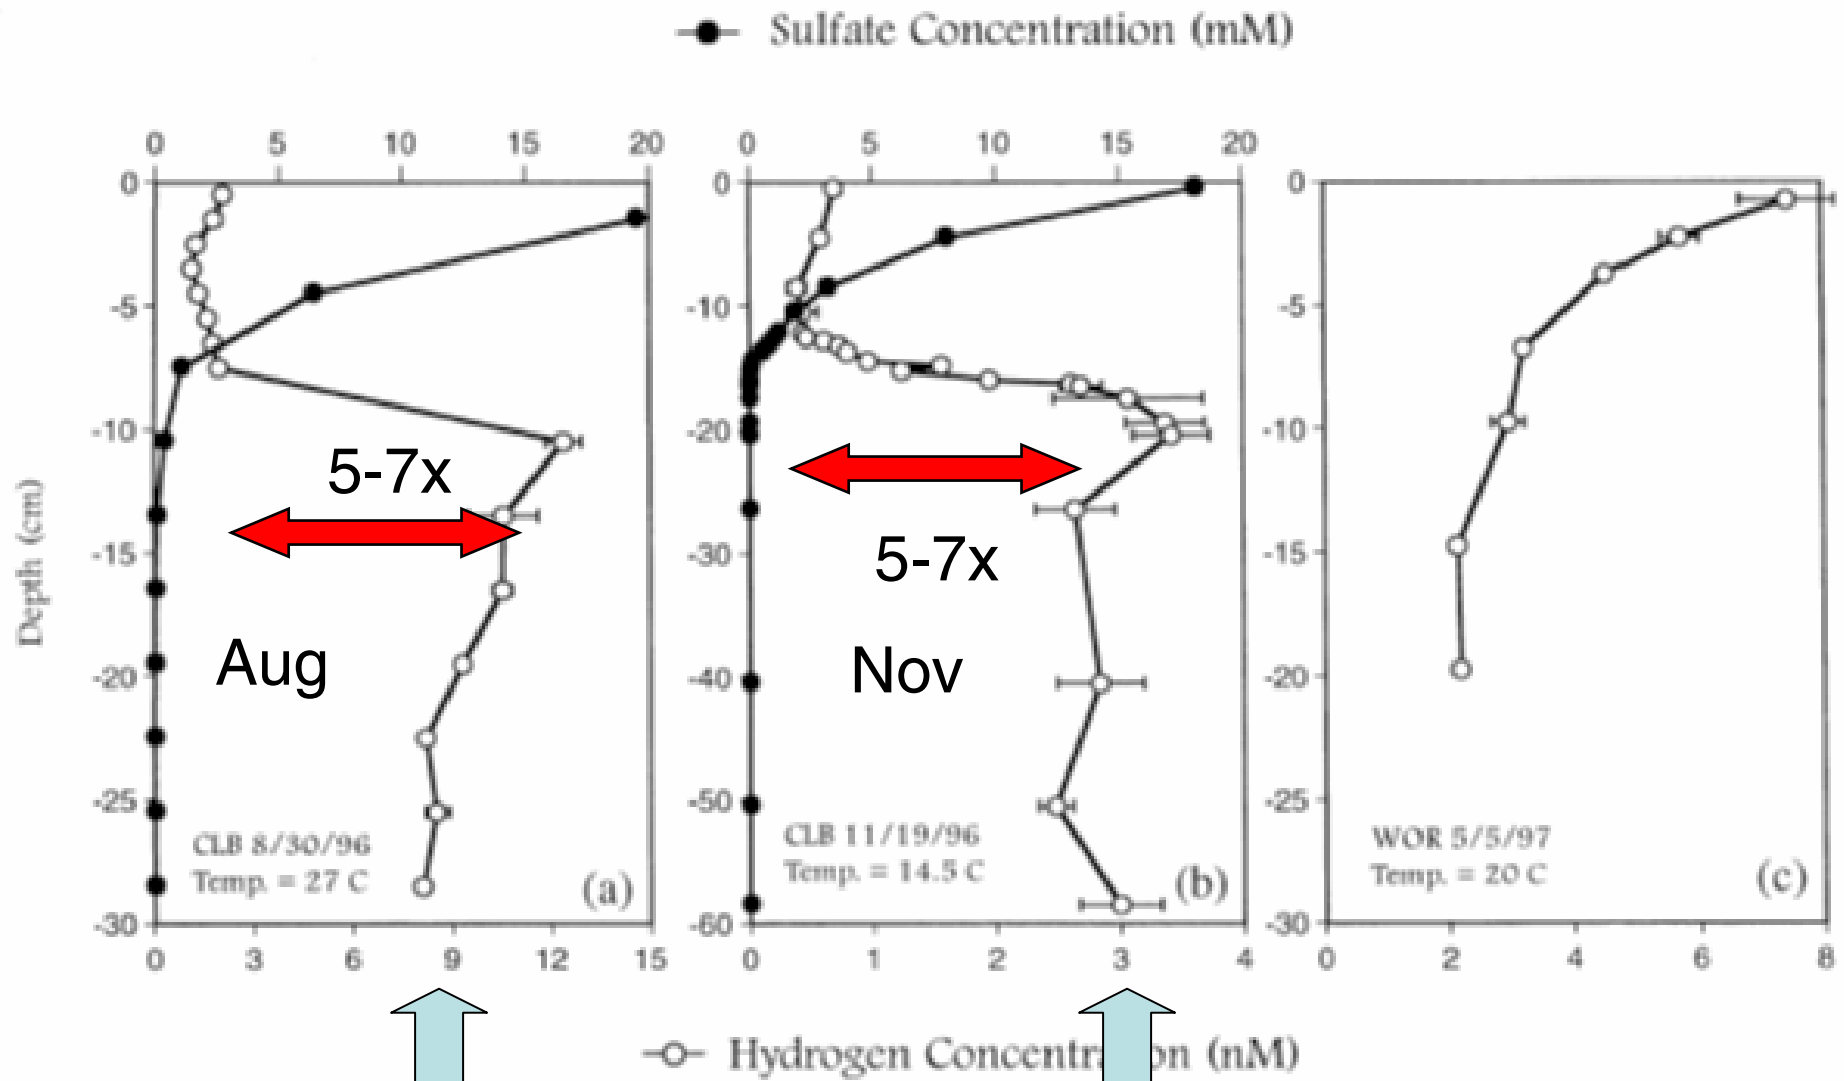

Effect of TEA on H₂ concentrations

TEAP	[H ₂] (nM)	ΔG(kJ mol ⁻¹)
Nitrate redn	0.031	<-180
Sulfate redn	1.64	-23
Methanogenesis	13.0	-20
Acetogenesis	133	-18

Profiles of hydrogen and sulfate in CLB and WOR sediments

2.8x meas vs 2.7x predicted

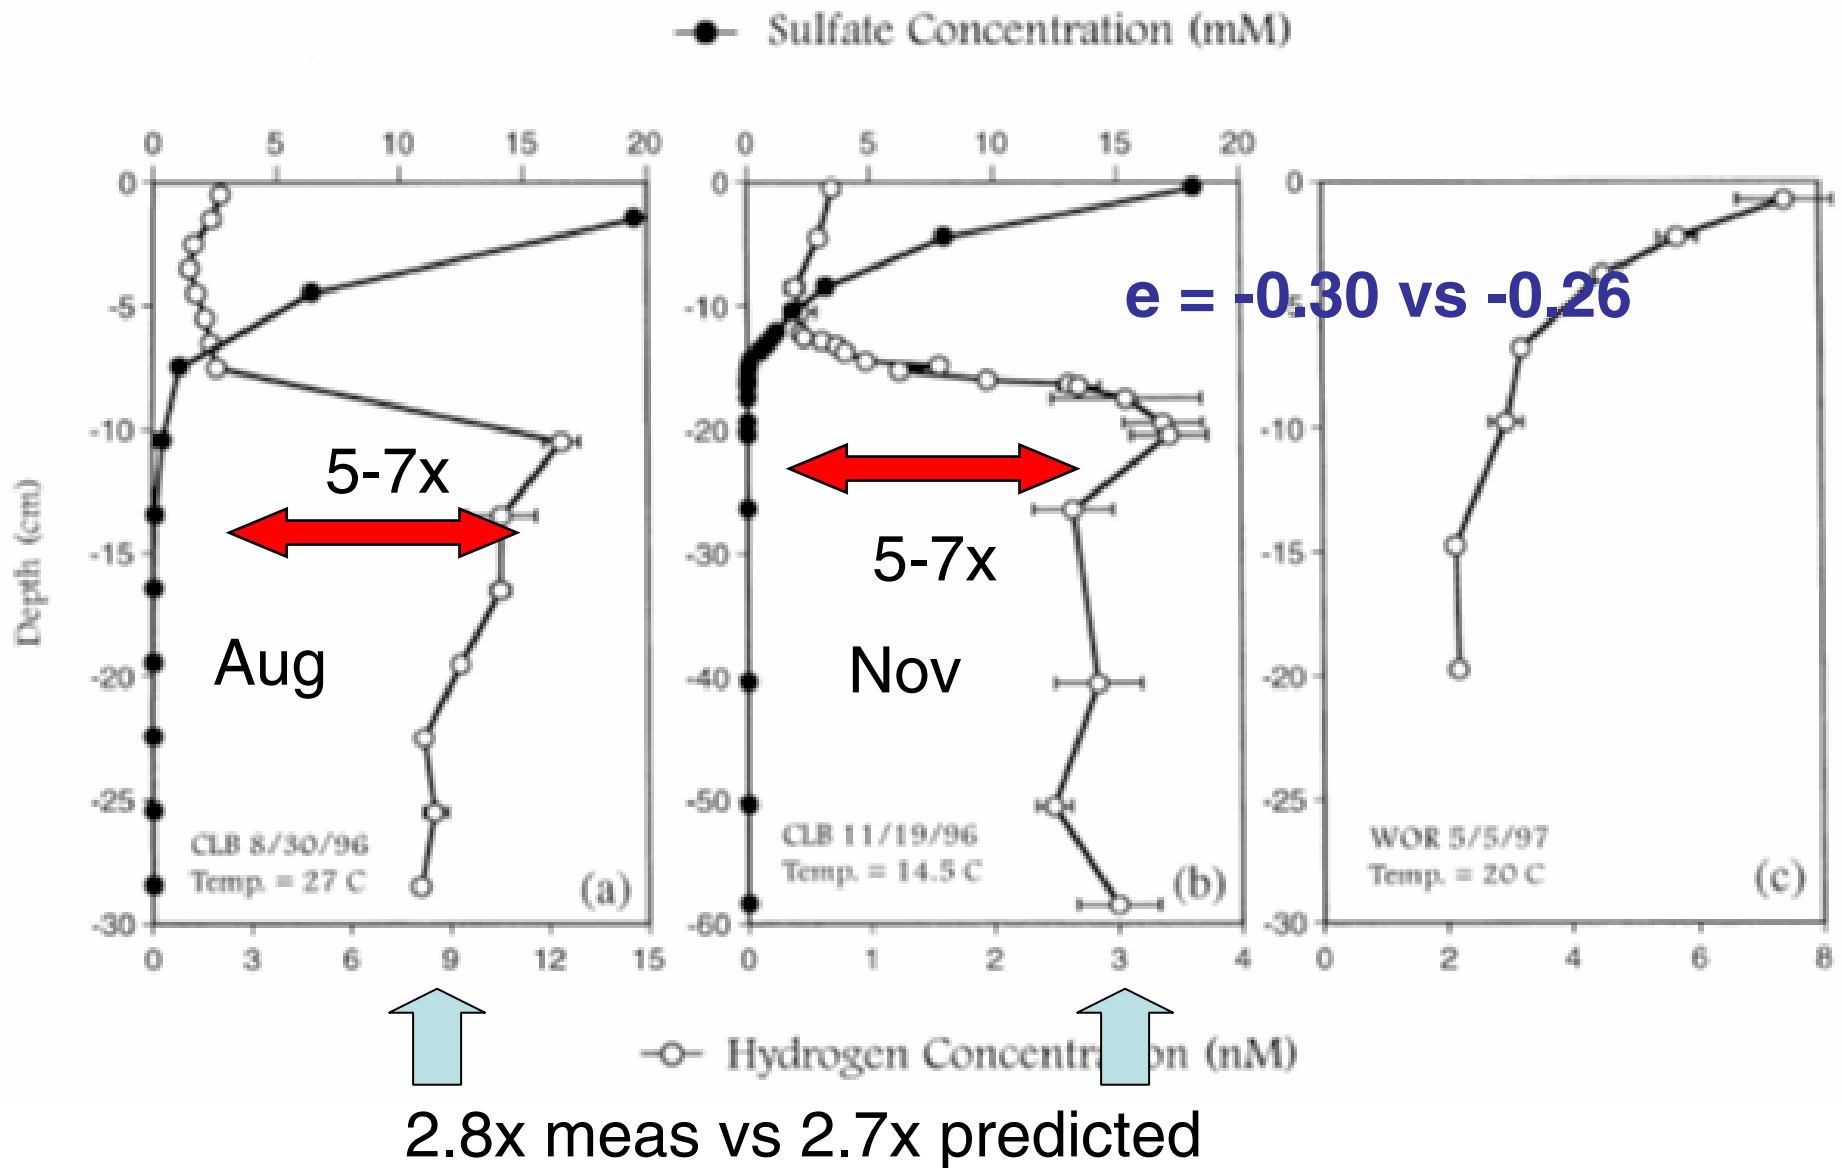

Effect of temperature on H₂ concentrations

ΔT from 10 to 30°C
Will affect ΔG_{rxn} by
 $+15 \text{ kJmol}^{-1}$

Theoretical
effect

Profiles of hydrogen and sulfate in CLB and WOR sediments

Effect of sulfate on H₂ in CLB sediments

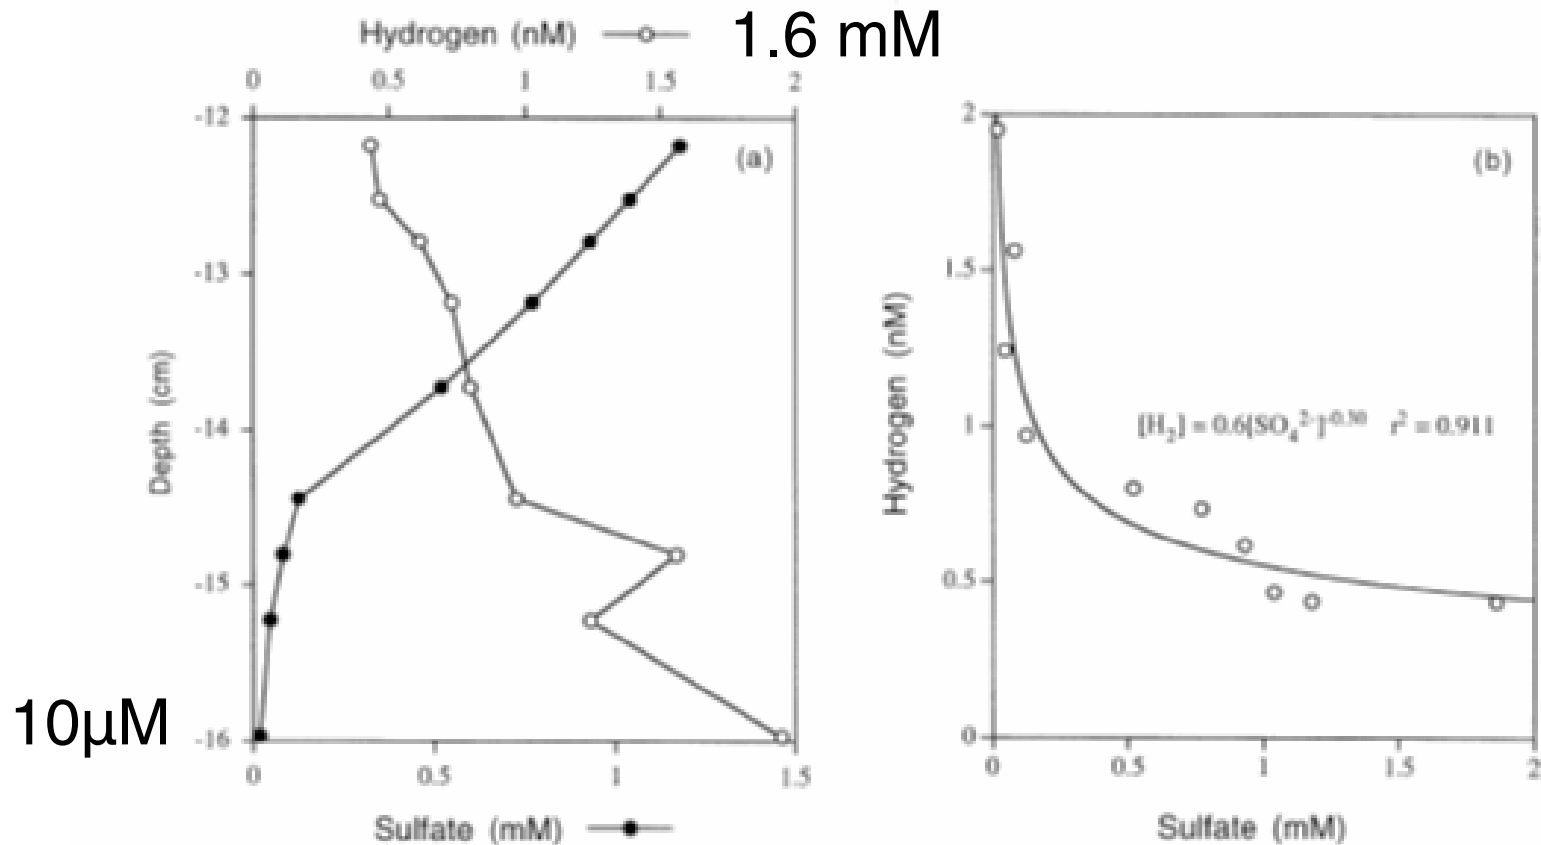

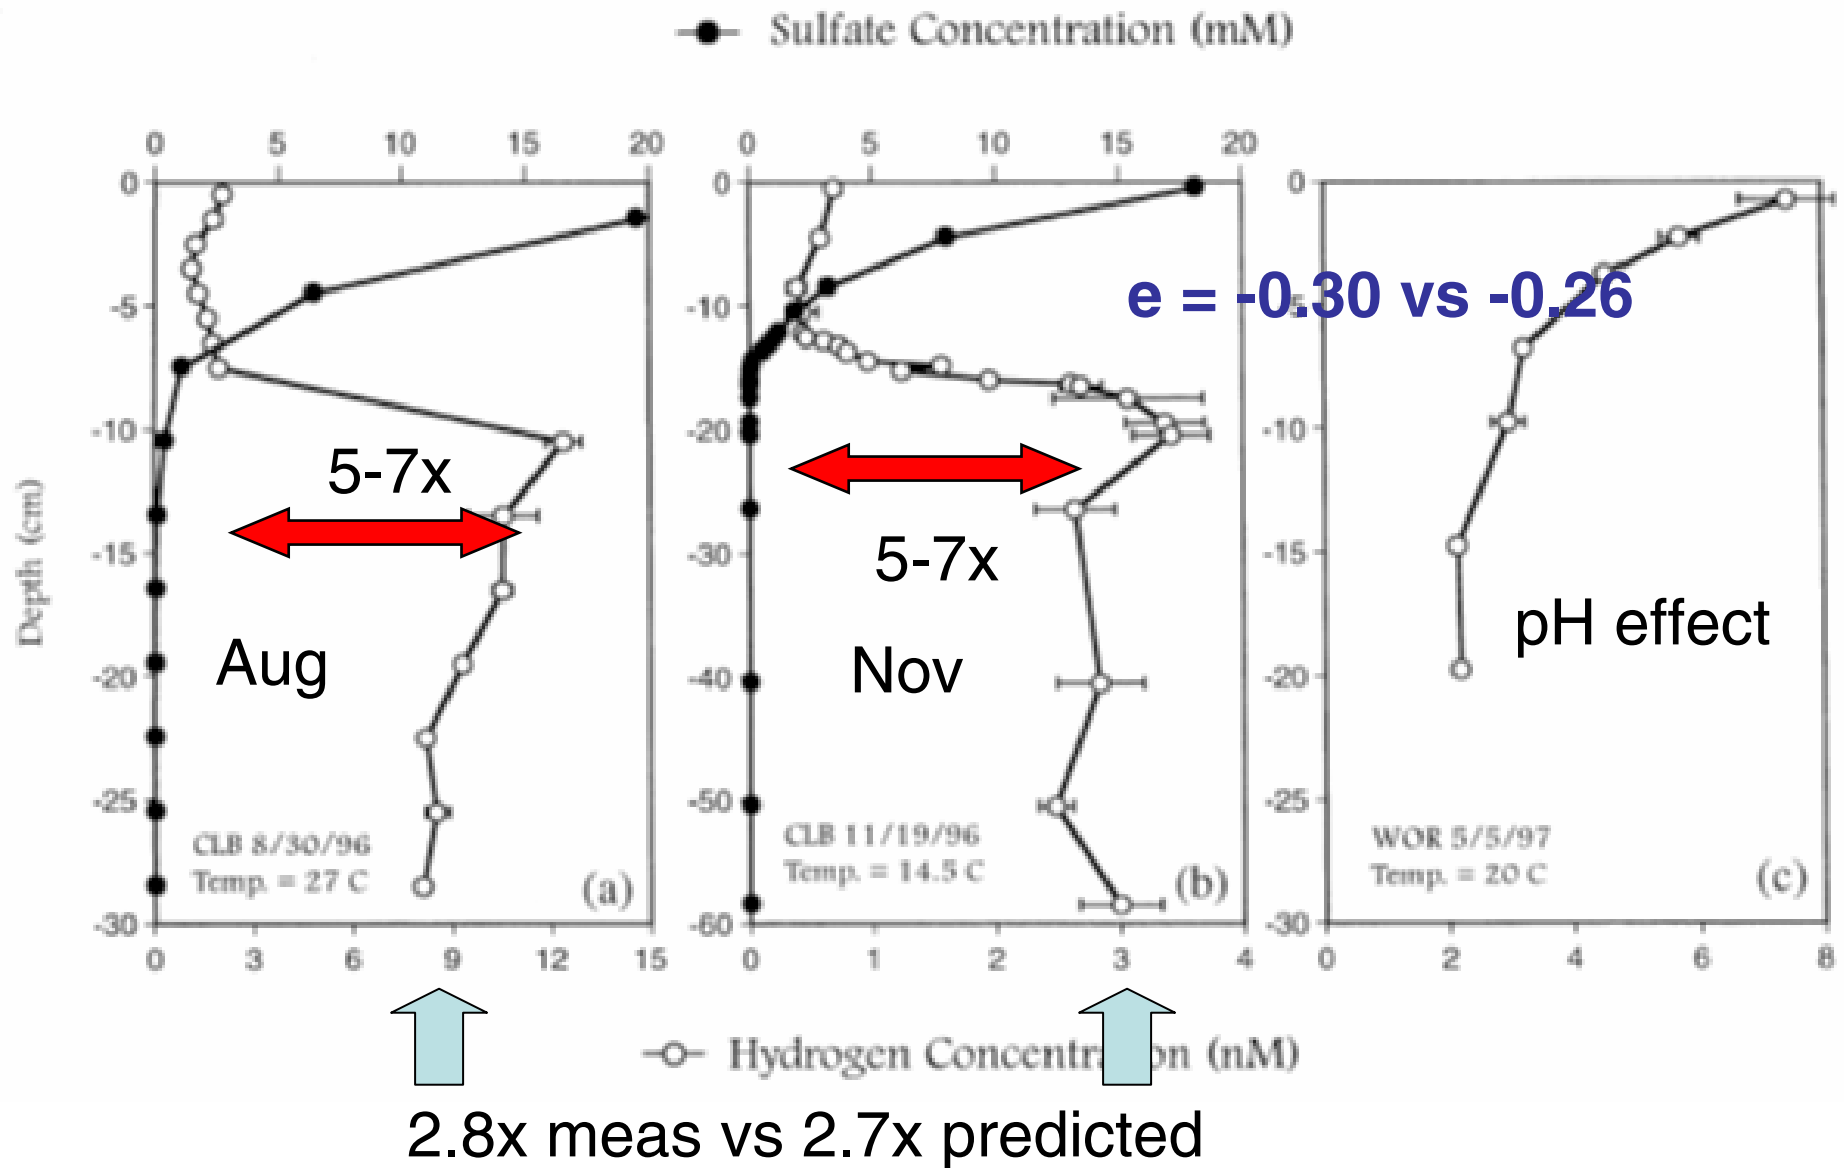

Fig. 8. The dependence of hydrogen concentrations on sulfate concentrations in the November core from Cape Lookout Bight (Fig. 7b). (a) blow-up of the 12–16 cm depth interval. Note that sulfate concentrations only reach threshold values below 16 cm; (b) plot of hydrogen concentration vs. sulfate concentration over the 12–16 cm interval. A power function fit to the data indicates that hydrogen has an exponential dependence of 0.30 ± 0.04 on sulfate (compared to a lab value of 0.26 ± 0.01 and a theoretical value of 0.25).

Profiles of hydrogen and sulfate in CLB and WOR sediments

Hydrogen as a control on organic matter oxidation In anoxic sediments (fresh and marine)

Hydrogen is a by-product of fermentation and is essential for sulfate reduction and methanogenesis.

Hydrogen concentrations respond to T, [X], pH.
Laboratory changes correspond well to field observations.

Variations in H_2 suggest maintenance of constant ΔG values of -10 to -15 kJ mol⁻¹ .

H_2 has a very short lifetime in sediments- makes an Excellent E regulator. Small changes in H_2 concentration Results in large changes in ΔG .

Intense competition by bacteria regulate $[H_2]$

Methane and the Global greenhouse

atms. Methane is increasing in concentration by about 1-2% per year.

Natural Sources of Atmospheric Methane

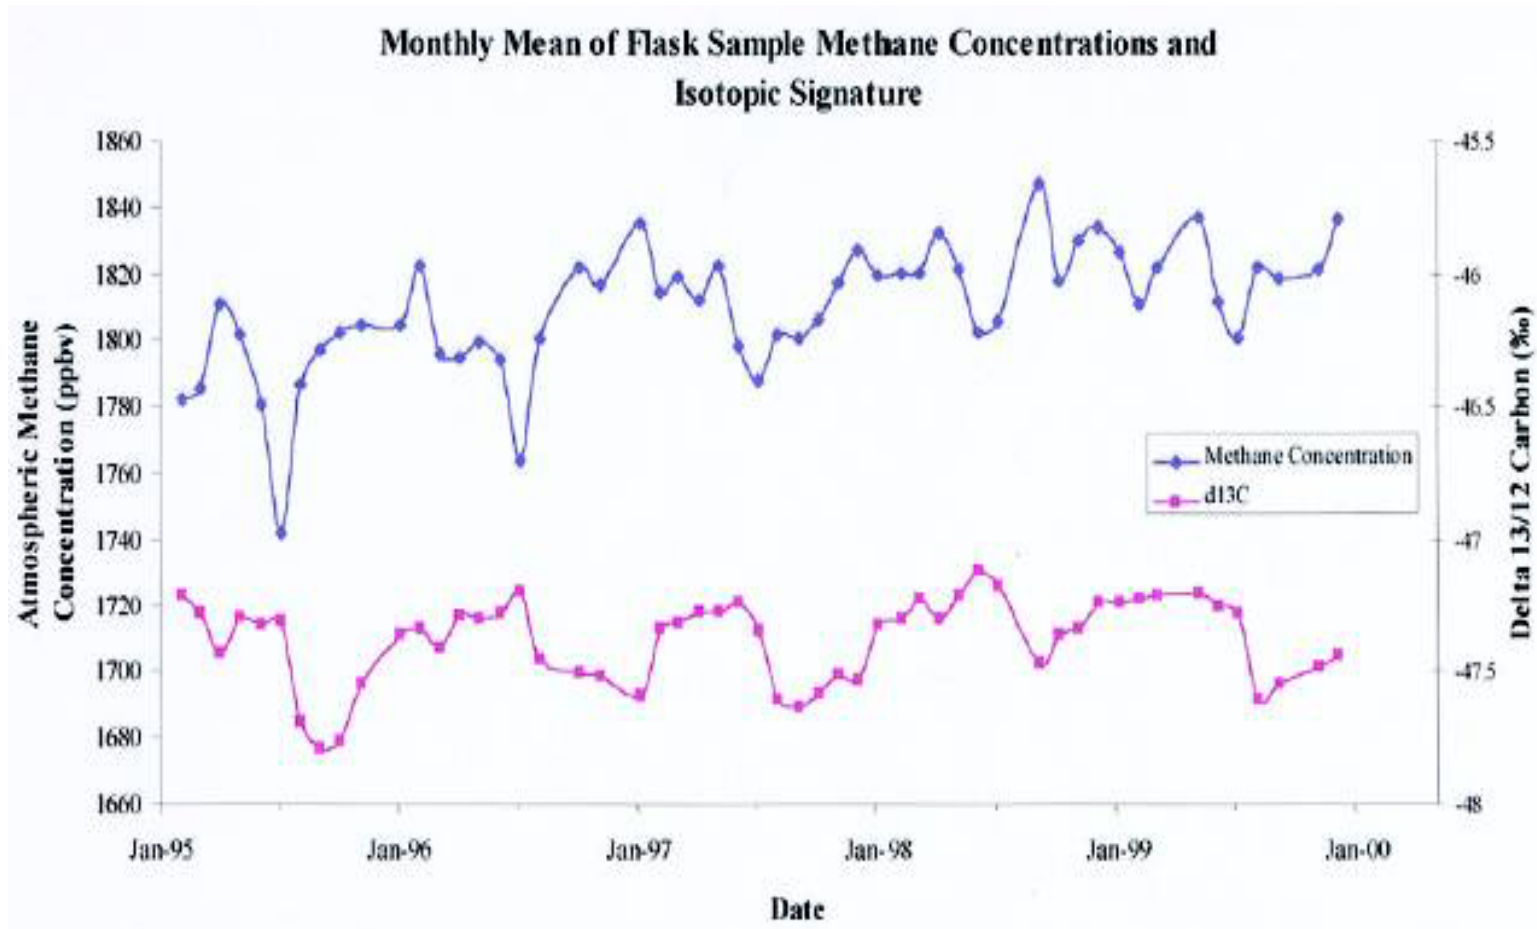

Concentrations and

C isotopic changes
in atms methane

C isotopic changes in atmospheric methane

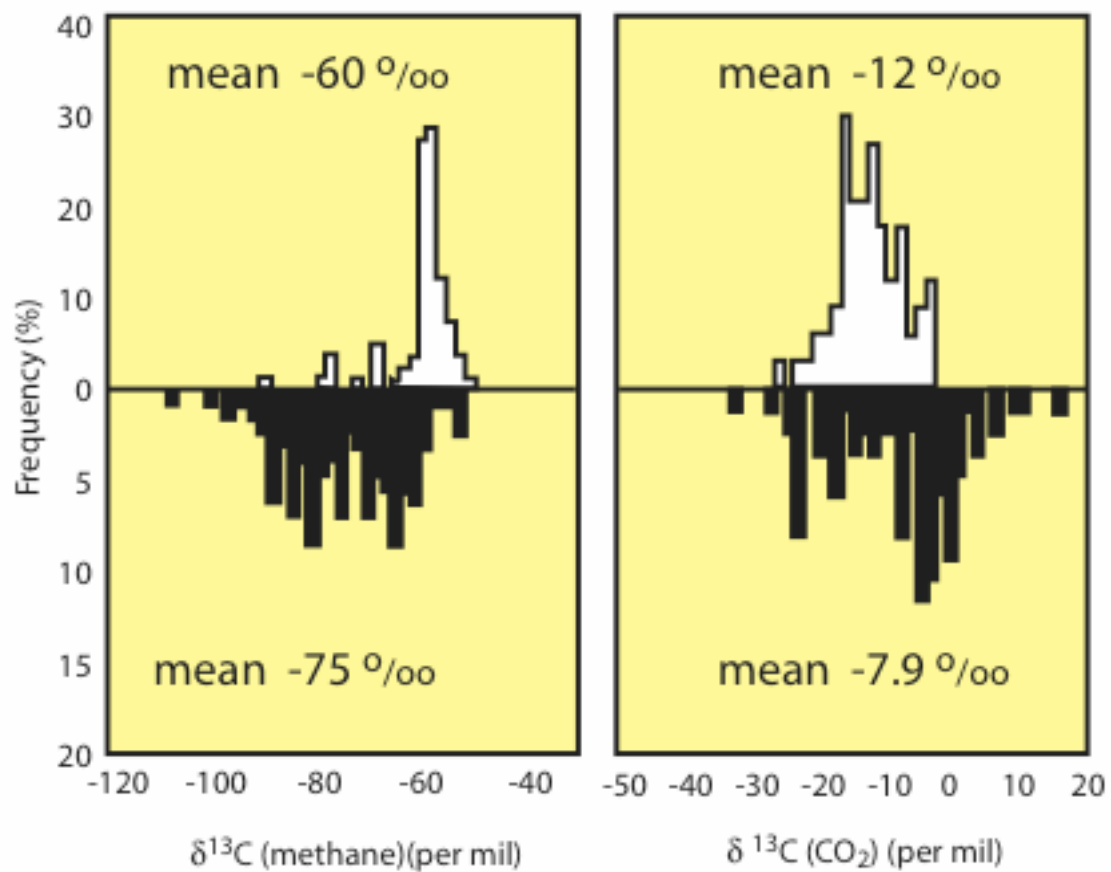

How do we explain the increase in atmospheric ?

Why is there a seasonal cycle in methane concentration?

Why is there a seasonal cycle in methane C isotopes?

(can C isotopes be used to understand and
Quantify processes that lead to atms increase?)

Freshwater

Marine

There are two pathways that yield methane:

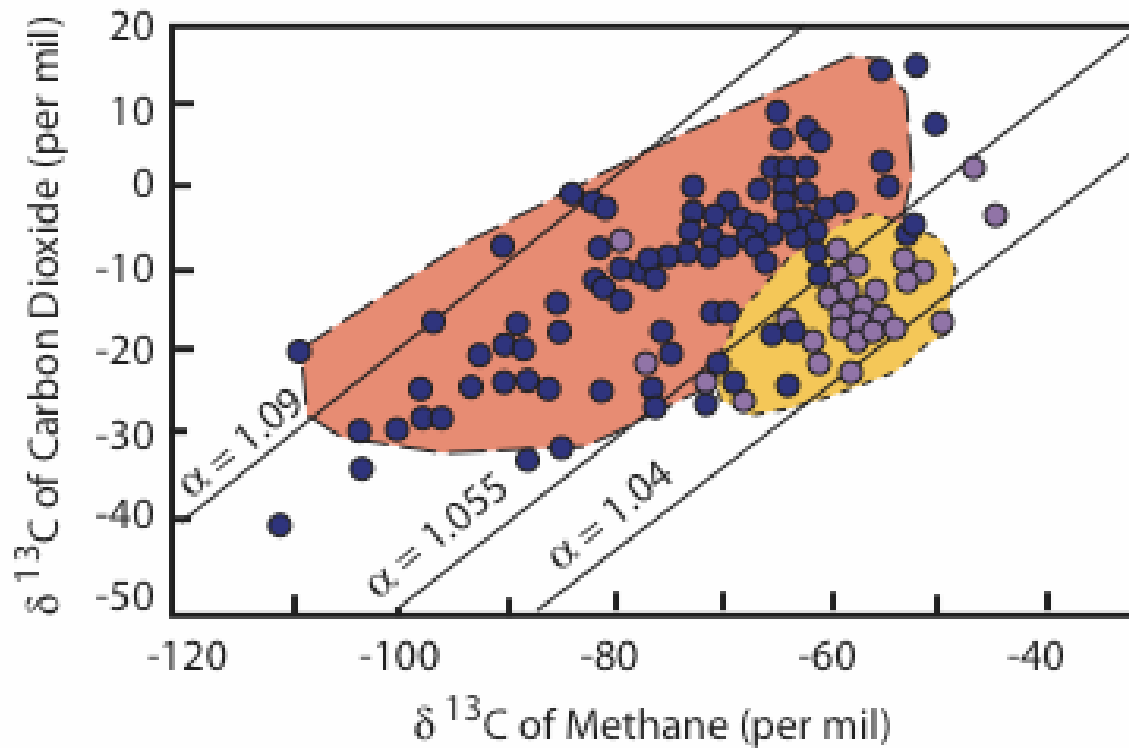

Freshwater

Marine

Isotope fractionation and methanogenesis

Carbon isotope fractionation with methanogenesis

Freshwater

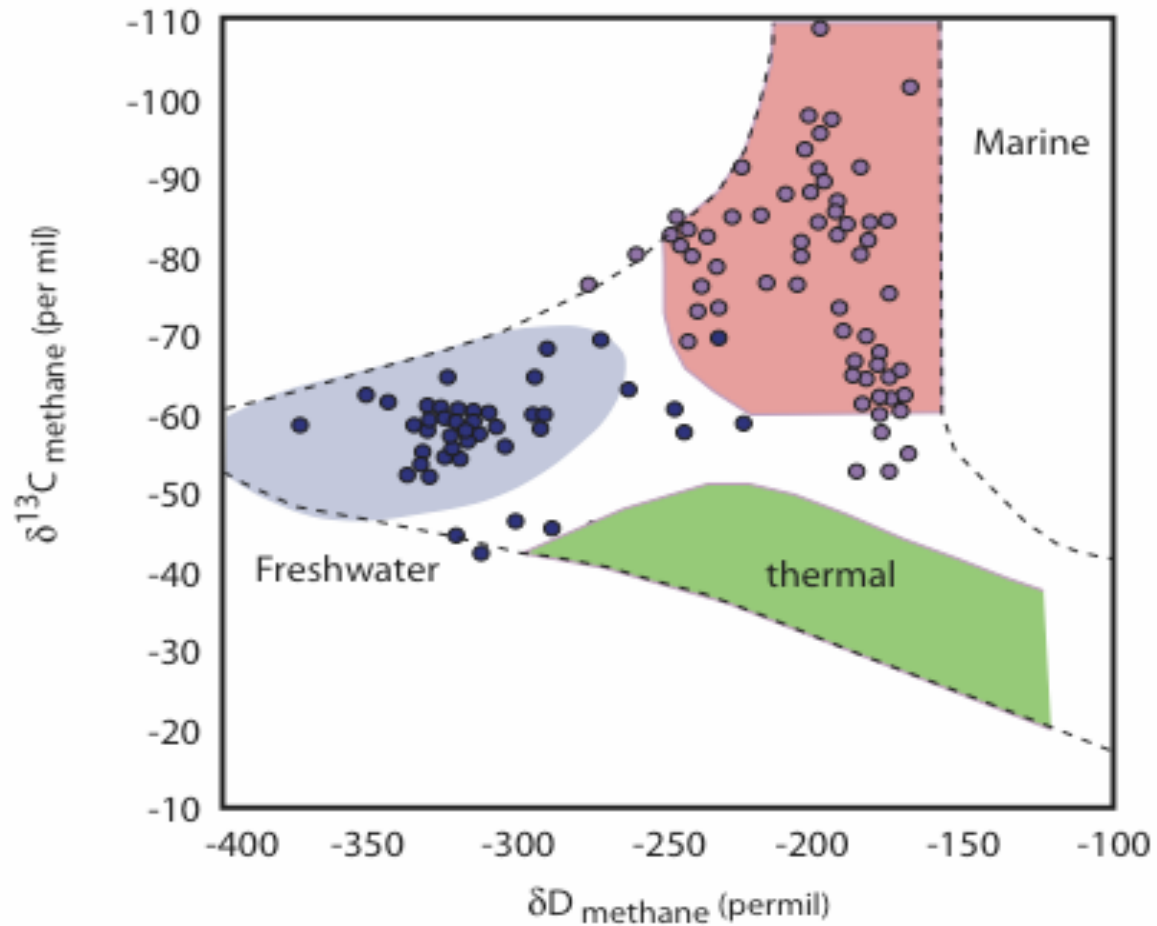

$$\alpha = -48\text{‰}$$

Marine

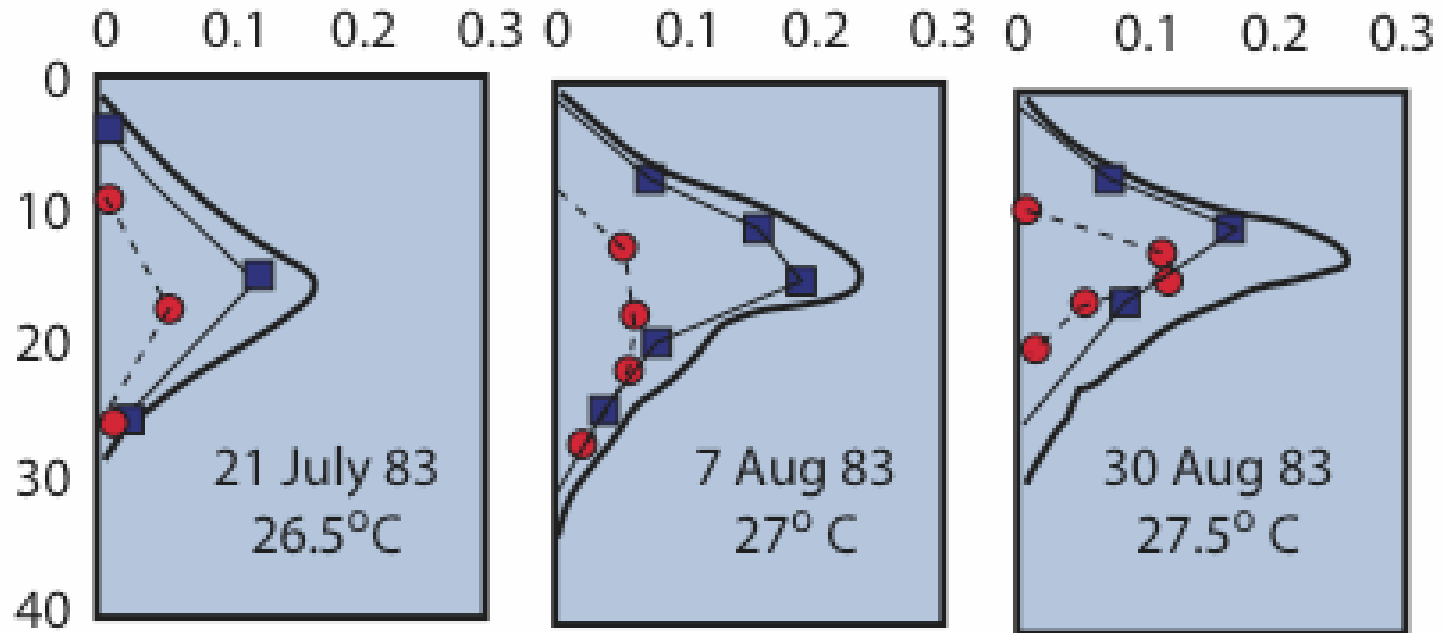

$$\alpha = -70\text{‰}$$

Carbon and Hydrogen isotopes fractionation with methanogenesis

Production of methane from acetate and CO₂
in CLB sediments. ¹⁴C tracer studies.

¹⁴C tracer rates

Seasonal changes in ^{13}C for methane and CO_2

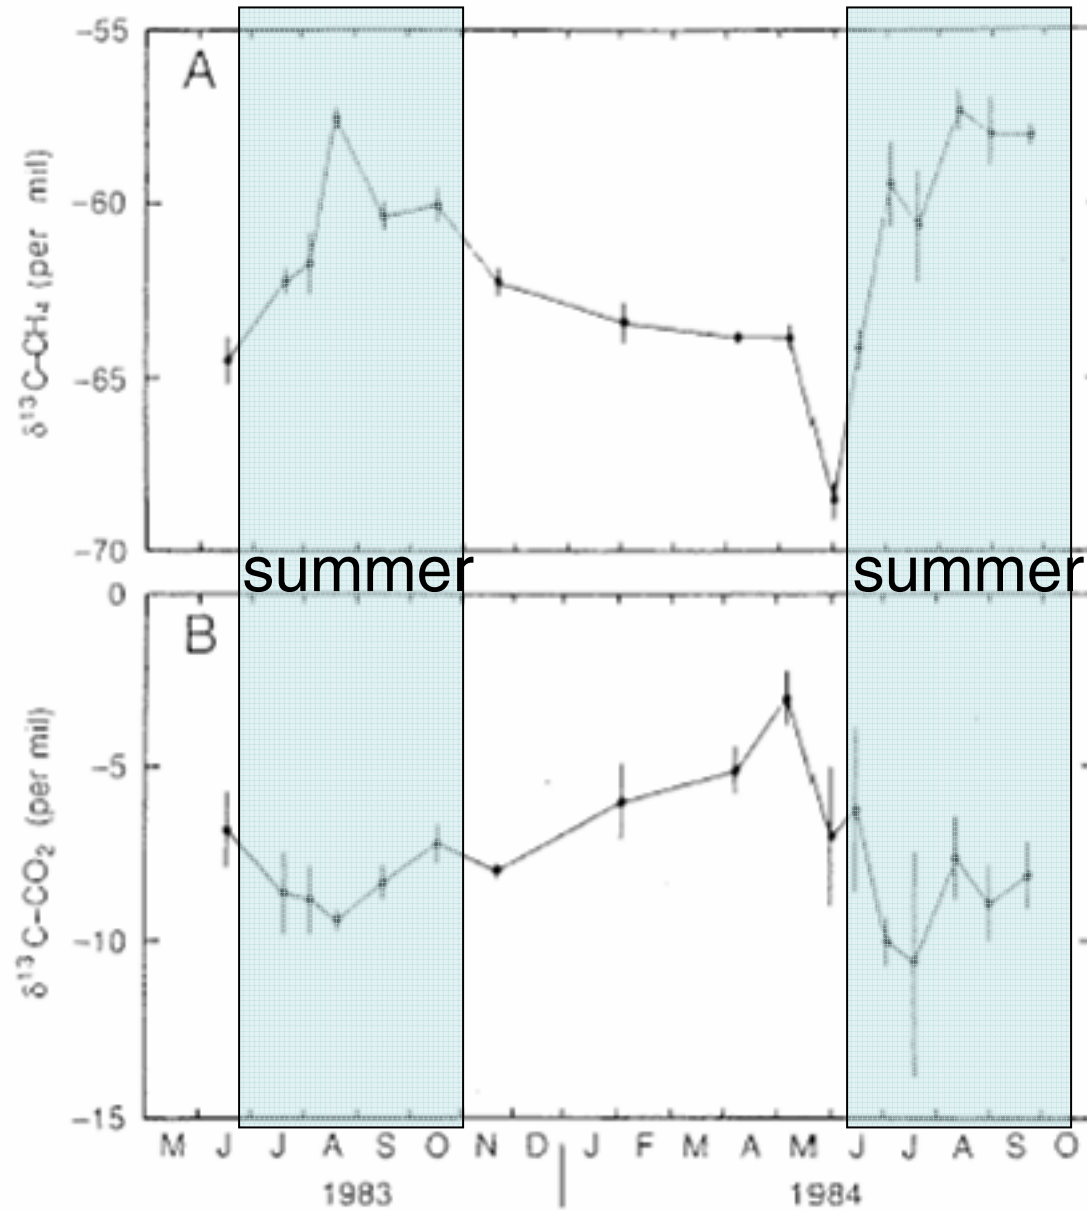

Table 1. Cape Lookout Bight sediment gas bubble composition and $\delta^{13}\text{C}$ data. Values listed are means \pm SD for the number of sample bottles listed. Superscripts indicate the number of samples for which compositional data were obtained when different from the number of sample bottles listed.

Date	Methane sample bottles (no.)	Methane content (%)	$\delta^{13}\text{C}\text{-CH}_4$ (per mil)	Carbon dioxide sample bottles (no.)	Carbon dioxide content (%)	$\delta^{13}\text{C}\text{-CO}_2$ (per mil)

Anaerobic methane oxidation...where has all the methane gone?

Oceans have a huge reservoir of methane in sediments, but contribute only 2% of the global atmospheric flux of methane.

Several lines of evidence suggest methane is being efficiently oxidized before it reaches the sediment water interface:

- curvature in methane profiles

- radiotracer experiments

- isotopic fractionation between methane and CO₂

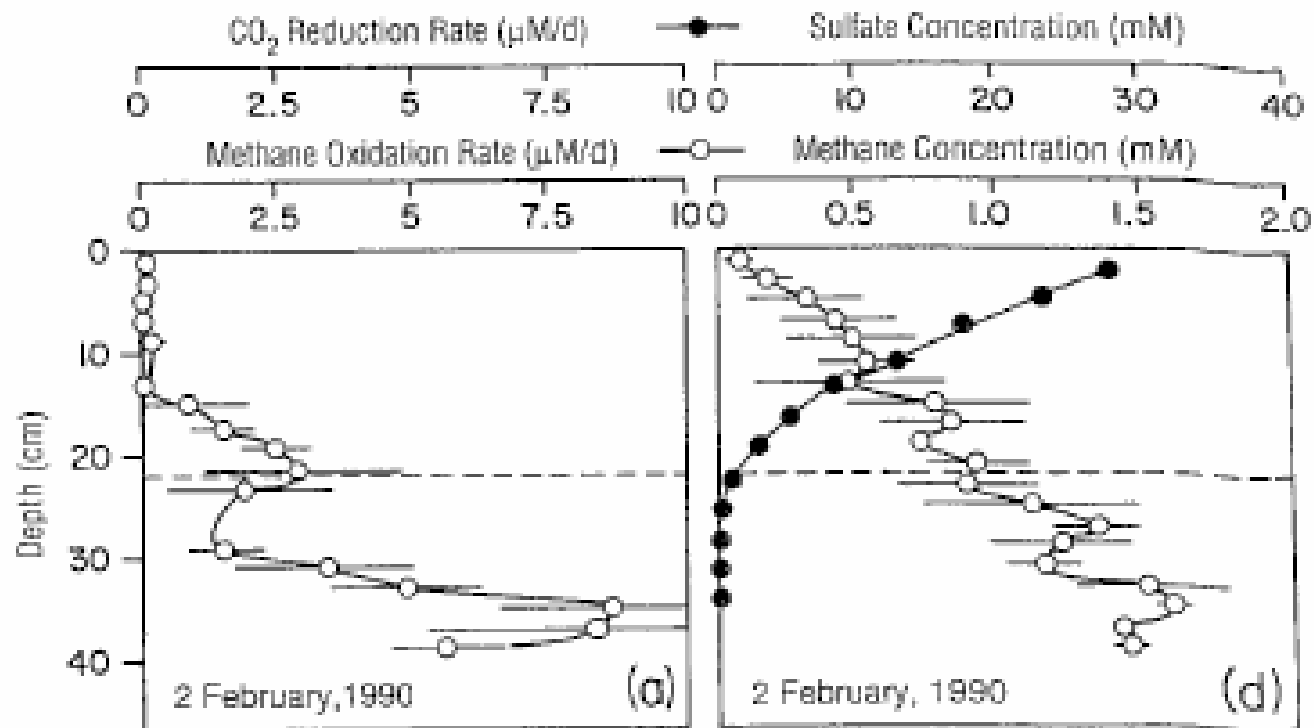

- measured rates of methane oxidation in sulfate reduction zone.

Energetically favorable, but ratio of SRR/MOR is very high (>99.99).

Anaerobic methane oxidation probably occurs as a consortia between SRB and MOB

Coupled methane oxidation and sulfate reduction in CLB sediments

Methane oxidation
and CO₂ reduction to
methane in CLB sediments
