

x564 - test float

Data was recorded once daily for a 21-day mission. The first four days were on deck, so no useful data returned (see black vertical lines at record no. 4). In TOA windows 1:5, correlations are on a scale of 0:20:140; plus signs indicate correlations less than 80; dots indicate correlations 80 or above. Sound source D heard in window 3; sound source C not heard in window4, and presumed 'dead'. Sound sources A, B, and German sources in Lab Basin were not expected to be heard due to geometry of sources with float. Pressure record is affected by rollover, and pressures of this float are actually at about 820 dbars.
